## Abstract

A brief summary of our ideas

**Keywords:** blah, blah

---

## 1 Introduction

In a famous paper, Box & Cox ([1964](#)) introduced a family of transformations ...

**Figure 1:** *Simulated data from a  $N(0,1)$  distribution.*

Figure 1 shows a kernel density estimate of simulated data from a  $N(0,1)$  distribution. The sample variance is given by

$$s^2 = \frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2 = 0.98. \quad (1)$$

Note that Equation 1 is an unbiased estimate of the variance, but it is not the maximum likelihood estimate (Rice [2007](#), p.269).
