# Our great idea

#### **Abstract**

A brief summary of our ideas

**Keywords:** blah, blah

### 1 Introduction

In a famous paper, Box & Cox (1964) introduced a family of transformations ...

**Figure 1:** *Simulated data from a* N(0,1) *distribution.* 

Figure 1 shows a kernel density estimate of simulated data from a N(0,1) distribution. The sample variance is given by

$$s^{2} = \frac{1}{n-1} \sum_{i=1}^{n} (x_{i} - \bar{x})^{2} = 0.98.$$
 (1)

Note that Equation 1 is an unbiased estimate of the variance, but it is not the maximum likelihood estimate (Rice 2007, p.269).
